

# CNW 8981 - 60 Hz

REOWAVE<sup>passive</sup> - harmonic filter 60 Hz/480 V (IP20)

## Unique Selling Point

In addition to providing excellent harmonic filtering performance, the REOWAVE<sup>passive</sup> can also be supplied with these additional options:

- Overcurrent indication signals
- Temperature monitoring
- Floating signalling contacts
- Automatic disconnection of the filter in the event of a system problem
- Reduction of the THDI value
- Increasing network stability
- Reduction of input current up to 30%
- Suitable for installation in control cabinets
- Easy integration into existing systems
- Increased reliability of electrical installations
- Optional with overcurrent signal to monitor the filter effect

The options allow optimisation of the mains network quality and overall system security and allow better monitoring by a PLC or supervisory system.

## Description

Reduce Harmonics - save up to 30% energy costs.

The REOWAVE<sup>passive</sup> filters harmonics caused by the B6 circuit (thyristor, diode bridge, etc.) and motor drives. The supply network is relieved by compensating the harmonics reactive power. This enables cost savings in material selection and energy consumption. Starting currents and current peaks are greatly attenuated.

This increases the service life and reliability of electrical systems. Due to the compact and ready-build an easy installation is possible.

The REOWAVE<sup>passive</sup> helps to comply with international power quality standards IEEE 519 or EN 61000-3.

- Nominal voltage: 480V
- Frequency: 60Hz
- In accordance with: EN 60289 / EN 61558
- Test voltage: L-L 2500 V, DC 1min; L-PE 2500 V, DC 1min
- Insulation class: T40 / F
- Protection: IP20
- Climate class: IEC 60068-1 DIN
- Protection: IP 20 (also available as IP00 version)
- Nominal voltage: 480V / 60 Hz
- Standards: IEEE 519, EN 61000-3-12, EN 61000-3-2, IEC 61000-3-4

## Technical Data

- Nominal Voltage : 480 V
- Rated current : 9 - 1200 A
- Frequency : 60 Hz

## Typical applications:

- Drive technology for motor drives , e.g.:
- Engineering
- Elevators / escalators
- Pipe
- Conveyor Technology
- Ventilation and air conditioning
- Robotics
- Automation Technology
- Power Supplies
- Failsafe processes
- Applications with a 6- pulse rectifier

## REOWAVE<sup>®</sup>passive

Save money with less reactive power

In the course of rising energy costs and growing CO2 emissions minimizing losses in the transmission grid gains more and more importance. An important factor are the reactive currents. These currents do not contribute to the effective power, but stress all components in the current path and cause additional losses to the ohmic resistance component of the lead. Reactive currents are, for example, harmonics caused by the usage of frequency.

However, reducing the energy efficiency is not only a burden on the environment because more energy is consumed for a steady performance - at the same time the costs increase for the operator of the installations, as they have to pay the reactive power.

Mains chokes, DC chokes or Harmonicfilter of REO filter unwanted harmonics and help to counteract the resulting reactive current. Thus, the reactive power is diminished, the energy requirement and the running costs are reduced.

Measurements at a frequency converter of 22 kW to the motor shaft

	unfiltered	1% Uk-mains choke	2% Uk-mains choke	4% Uk-mains choke	REOWAVE passive
$I_{input}$ [A]	42,4	41,6	37,7	35,8	32,0
Q [kvar]	19,6	18,0	15,2	10,2	2,5

Current and power factor at a REOWAVEpassive CNW 8981 / 6 -1200A / 400V / 50Hz

*REOWAVE<sup>®</sup>passive - harmonic filter 60 Hz/480 V (IP20)*

**NEW!** Overcurrent signal to monitor the filter effect

The REO overcurrent indication signals at anytime your energy efficiency.  
You can track your power consumption:

- GREEN = power consumption about 80% (based on the rated current of the filter)
- YELLOW= power consumption about 100% (based on the rated current of the filter)
- RED= power consumption above 105% (based on the rated current of the filter)

The REOWAVE<sup>®</sup>passive filters  
harmonics,  
and ensures:

Reduction of the THDI value

Increasing network stability

Reduction of current consumption

Reduction of equipment costs

Simple integration into  
existing systems

Temperature monitoring

Bespoke electronics monitor the operating temperature of the inductive components, used within the filter. If these exceed the safe operating temperature, a potential-free contact will indicate this.

Disconnection of the filter function in case of failure

If an overtemperature condition is discovered the mains is automatically disconnected after a pre-determined delay in order to avoid permanent system damage.

All error messages are reset when the power is again returned to the rated operating condition.  
Optionally with corresponding plugs and sockets for immediate use without large installations, - like that, immediate beginning of the savings !
